The image shows a Scratch script for processing an image and performing OCR. The script starts with a 'when Button1 Click' event. It then sets the 'Image1' picture to either a 'pdf' file from a device or an 'image' file from a device. A 'stop' block is used to clear any previous audio, followed by a 'play' block for a sound effect. The script then constructs an OCR API URL by joining a base URL with the image's file path. A 'call' block is used to fetch the image data from the API, with outputs for 'response', 'status', and 'error'. A 'then do' block handles the response: if there is an error, it sets the label text to the error message and plays a sound effect. If successful, it extracts the 'ParsedText' from the response, replaces all instances of '\n' with a newline character, and checks if the response is empty. If empty, it plays a sound effect. If not empty, it sets the label text to 'Loading' and enters a loop that repeats 5 times, updating the label text to 'Loading..' and 'Loading...' with 0.1-second delays. After the loop, it sets the label text to 'Completed!' and waits 1 second before navigating to 'Screen2'. Finally, it sets an app variable 'FULL response' to 'true' and waits 0.05 seconds.

```
when Button1 Click
do
  set Image1's Picture to pdf file from device or image file from device
  stop ttsMP3.com_VoiceText_2026-1-29_11-9-41.mp3
